18. 밑줄 친 (a)-(e) 중, 어법상 오류를 포함한 문장을 고르시오¹⁾

Dear Principal Jones,

I hope this message finds you well. (a)As student council president, I am reaching out to discuss an important matter regarding our school library's current operating hours. (b)At present, the library closes at 5 p.m., which many students feel limits their ability to fully use its resources for study and research after regular class hours. (c)This is particularly challenging for those preparing for college entrance exams or working on academic projects that demand a quiet and resourceful environment. (d)Therefore, I'd like to ask you extending the library's operating hours to 7 p.m. This change would greatly benefit students by providing additional time to focus on their academic goals. (e)I hope you will consider this proposal as a step toward improving our academic environment and better supporting our needs.

Sincerely, Eric Park Student Council President

I glanced at the clock on the wall. 10:00. That meant the casting director would call very soon with the results of my first audition for a musical part in The Wizard of Oz. I felt shaky all over, chewing my thumbnail and jiggling my feet. Finally, the telephone rang. While I was coming round, Dad answered. I heard him say, "Ahh, thank you. I'll let her (A)know..." As I got to the bottom of the stairs, he was just putting the phone down. "That was The Wizard of Oz. You're second senior munchkin," he announced. I got a little rush of excitement, (B)know I was in—that whatever happened I could be involved in one of the productions.

(A) : _____

(B) : _____

20. 주어진 문장이 들어가기에 가장 적절한 곳을 고르시오³⁾

It's no wonder that students are late for class; they have little reason to be on time.

Inefficient teachers overlook the potential power of the opening minutes of class. (①) Often, if students are quiet enough and if there are many pressing demands on a teacher's time at that moment, more than ten minutes can disappear before class starts. (②) You can use the first ten minutes to get your class off to a great start, or you can choose to waste this time. (③) The first minutes set the tone for the rest of the class. (④) If you are prepared for class and have taught your students an opening routine, they can use this brief time to make mental and emotional transitions from the last class or subject and prepare to focus on learning new material. (⑤) In summary, you should establish an opening routine to develop your class with an effective start.

21. 다음 글의 내용과 일치하지 않는 것은?⁴⁾

Many atoms in your body are nearly as old as the universe itself. When you breathe, for example, only some of the atoms that you inhale are exhaled in your next breath. The remaining atoms are taken into your body to become part of you, and they later leave your body by various means. You don't "own" the atoms that make up your body; you borrow them. We all share from the same atom pool because atoms forever travel around, within, and among us. Atoms cycle from person to person as we breathe and as our sweat is evaporated. We recycle atoms on a grand scale. The origin of the lightest atoms goes back to the origin of the universe, and most heavier atoms are older than the Sun and Earth. There are atoms in your body that have existed since the first moments of time, recycling throughout the universe among limitless forms, both nonliving and living. You're the present caretaker of the atoms in your body. There will be many who will follow you.

① Atoms move between people as we breathe continuously.
② Humans are temporary caretakers of borrowed atoms.
③ Light atoms originated at the universe's beginning.
④ Heavier atoms are generally younger than the Sun.
⑤ Atoms recycle through both living and nonliving forms.

22. 다음 글의 문맥상 빈칸 (A)에 들어갈 말을 주어진 철자로 시작하는 단어를 본문에서 찾아 쓰시오⁵⁾ (필요시 단어형태 변형)

The act of (A)g_____ itself is a fantastic form of physical activity. It involves a range of motions, from digging and planting to watering and harvesting. These activities help improve strength, flexibility, and endurance. You might not realize it, but small tasks like weeding or turning compost can burn many calories. Gardening is particularly beneficial for those who find traditional exercise challenging. It's a low-impact way to stay active and fit, making it accessible for people of all ages and physical abilities. Besides physical health, gardening has profound mental health benefits. Tending to plants can be incredibly calming and meditative. It allows you to focus on the present moment, reducing stress and anxiety. The repetitive tasks involved in gardening can induce a state of mindfulness, similar to meditation. Studies have shown that spending time in nature, even in a small garden, can elevate mood, improve cognition, and reduce depression symptoms. The sense of accomplishment from watching your plants grow and thrive can also boost self-esteem and overall well-being.

(A)g_____

23. 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?⁶⁾

For many centuries, humans have taken ①advantage of tools that translate and bring into our perception natural phenomena that we can't perceive with our senses. In some cases, this consists of simply ②amplifying signals that feed into our normal sensory inputs (e.g., telescopes can bring into clear view that which is too far away for our eyes to perceive on their own). Other instruments turn signals that we cannot perceive into ones that we can observe. Some of these take the form of ③expanding the reach of our current senses, such as creating visible images based on the ultraviolet spectrum of light or changing sounds that are normally ④within the range of what human ears can hear into audible signals. Alternatively, some instruments measure properties for which we have no sensory capacity at all and ⑤change them into that which we can observe.

24. 다음 글의 요지로 가장 적절한 것은?⁷⁾

Many opponents of animal experimentation argue that not only is modern medicine not the only cause for the decline in mortality, many medical advances that did contribute to human health were not the result of animal experimentation. Defenders of research have claimed that since there is a strong correlation between the practice of animal experimentation and medical advancement, the former caused the latter. Opponents of research reject this inference. After all, we have independent reasons to expect these phenomena to be correlated. Since the law prescribes that all new drugs, prosthetic devices, and surgical techniques be tried on animals before they are used in humans, we will subsequently find that all medical advances are correlated with prior experimentation on animals. Consequently, the correlation between animal experimentation and medical discovery is the result of legal necessity, not evidence that animal experimentation led to medical advances. Moreover, several influential physicians have offered historical evidence that animal experimentation has not been as responsible for biomedical discovery as defenders suggest. They claim that clinical discoveries played a more substantial role than animal researchers have led us to believe.

- ① 신약은 환자에게 쓰이기 전에 충분한 임상 시험 기간이 필요하다.
- ② 실험에 사용되는 동물들의 생명권에 대한 논의가 이루어져야 한다.
- ③ 임상적 발견이 전반적인 의학적 발전에 절대적으로 기여해 왔다.
- ④ 동물 실험이 의학적 발전에 기여하는지에 대한 상반된 주장이 있다.
- ⑤ 객관성 확보를 위해 동물 실험에 사용되는 종의 다양성을 유지해야 한다.

26. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?⁸⁾

Roger Payne was born in Manhattan in 1935. He studied biology at Harvard University and eventually ①earned his Ph.D. from Cornell University in 1961. In 1967, he discovered that humpback whales make long and complex sounds. They're known as "whale songs," and he showed that whales use them ②to communicate. Then in 1970, he released an album Songs of the Humpback Whale, ③which became a surprise hit and helped start the global "Save the Whales" movement. The following year, he founded Ocean Alliance to protect whales and the earth's oceans, and he used new, safe methods to study whales without harming them. Over his career, he led more than 100 research trips worldwide, ④including the Voyage of the Odyssey from 2000 to 2005, which studied ocean pollution. His work helped make laws that ⑤protects marine mammals, which finally led to the global ban on commercial whaling in 1986.

*humpback whale : 혹등고래

29. 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?⁹⁾

Big mammalian herbivore species react to danger from predators or humans in different ways. Some species are nervous, fast, and programmed for ①instant flight when they perceive a threat. Other species are slower, less nervous, seek protection in herds, stand their ground when threatened, and don't run until ②necessary. Naturally, the nervous species are ③easy to keep in captivity. If put into an enclosure, they are likely to panic, and either die of shock or hit themselves repeatedly to death against the fence in their attempts to escape. That's true, for example, of gazelles, which for thousands of years were the most frequently hunted game species in some parts of the Fertile Crescent. There is no mammal species that the first settled peoples of that area had ④more opportunity to domesticate than gazelles. But no gazelle species has ever been domesticated. Just imagine trying to herd an animal that runs away, ⑤blindly hits itself against walls, can leap up to nearly 30 feet, and can run at a speed of 50 miles per hour!

30. 주어진 문장이 들어가기에 가장 적절한 곳을 고르시오¹⁰⁾

It's not just because they are nice people; it's because their survival depends on sharing, for they know that they may be the travelers in need of food and shelter another day.

For a species born in a time when resources were limited and dangers were great, our natural tendency to share and cooperate is complicated when resources are plenty and outside dangers are few. When we have less, we tend to be more open to sharing what we have. (①) Certain nomadic tribes don't have much, yet they are happy to share because it is in their interest to do so. (②) If you happen upon them in your travels, they will open up their homes and give you their food and hospitality. (③) Ironically, the more we have, the bigger our fences, the more sophisticated our security to keep people away and the less we want to share. (④) Our desire for more, combined with our decreased physical interaction with the "common folk," starts to create a disconnection or blindness to reality. (⑤)

31. 다음 글에서 전체 흐름과 관계 없는 문장은?¹¹⁾

Whether we feel happy or sad, content or discontent, is not determined merely by each individual successive moment of life experience – a good thing happens and I'm happy, a bad thing happens and I'm sad. While our experiences affect our mood, we are not blown in a completely new direction by each gust of wind. As humans, we adjust – to new information and events both good and bad – and return to our personal default level of well-being. ①There will be highs and lows, but over time, like water seeking its own level, we are pulled toward our baseline – back up after bad news and back down after good. ②The euphoria of first love fades, and so does the despair of a break-up. ③Emotional pain from a breakup can be alleviated and eased effectively through proper counseling sessions. ④This tendency is best seen with little kids and their toy joy: When they get what they've longed for, they believe they will be happy for the rest of their lives. ⑤And for the first few minutes of the rest of their lives, they are. But then the kids – like adults – adapt.

32. 주어진 글 다음에 이어질 글의 순서로 가장 적절한 것을 고르시오¹²⁾

Although you may put off going to sleep in order to squeeze more activities into your day, eventually your need for sleep becomes overwhelming and you are forced to get some sleep.

(A) Because of such built-in molecular feedback, you can't become accustomed to getting less sleep than your body needs. Eventually, a lack of sleep catches up with you.

(B) This daily drive for sleep appears to be due, in part, to a compound known as adenosine. This natural chemical builds up in your blood as time awake increases. While you sleep, your body breaks down the adenosine.

(C) Thus, this molecule may be what your body uses to keep track of lost sleep and to trigger sleep when needed. An accumulation of adenosine and other factors might explain why, after several nights of less than optimal amounts of sleep, you build up a sleep debt that you must make up by sleeping longer than normal.

One of the things that makes uncertainty difficult for members of the public to appreciate is that the significance of uncertainty is relative. Take, for example, the distance between Earth and the sun: 1.49597 X 108 km, as measured at one point during the year. This seems relatively precise; after all, using six significant digits means I know the distance to an accuracy of one part in a million or so. However, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is larger than the distance between New York and Chicago! Whether or not the quoted number is "precise" therefore depends on the _____. If I care only about what minute the sun will rise tomorrow, then the number quoted here is fine. If I want to send a satellite to orbit just above the sun, however, then I would need to know distances more accurately.

- ① technology
- ② context
- ③ budget
- ④ object
- ⑤ leadership

Richard Heinberg, an American journalist, argues that in building the renewable energy infrastructure to stop global warming, we are actually involved in one of the greatest change projects in human history. In addition to solar panels and wind turbines, we have to build an alternative transport infrastructure, farming procedures and industrial processes. This transformation cannot happen without fossil fuels. (A), production of concrete structures and steel elements require amounts of energy that is only possible to produce with fossil energy. Production of solar panels requires scarce and expensive minerals which must be excavated, again requiring the use of fossil fuels. (B), the harder we push towards a renewable energy system, the faster we have to use fossil energy for the construction process. This is not only expensive, but also an undermining factor for our efforts to cut global emissions. Heinberg remarks that the cost of building this new energy infrastructure is seldom counted in transition proposals, which tend to focus just on energy supply requirements.

Humans for centuries have dreamed of machines ①that could become intelligent and make human-like decisions. There have been myths about robots, automatons, and artificial beings since ancient Greece (e.g., the myth of Pandora, ②whose released ills upon the world). Likewise, literature throughout history has dreamed of creating human-like creatures and thinking machines (e.g., Mary Shelley's Frankenstein). In 1950, British mathematician Alan Turing asked ③whether machines could think and reason like humans and then developed the Turing test to measure a machine's intelligence and whether the machines can think autonomously. A few years later, MIT professor John McCarthy coined "artificial intelligence," ④replacing the previously used expression "automata studies." Since then, artificial intelligence has become the study and practice of "making intelligent machines" that are programmed ⑤to think like humans – endowed by their creators with reasoning and learning.

The desert tortoise has a simple solution for coping with Death Valley's extreme heat: It avoids it. The slow-moving creature hibernates during the winter and stays in its tunnel for much of the summer, meaning that it spends more than 90 percent of its life immobile. In fact, the tortoise usually only surfaces after a good rain. Then, it gets to work. The tortoise stocks up on water by eating plants and digging holes to collect rain. But to stay supplied with water through its extended hibernation, the reptile relies on something else – its highly sophisticated bladder. ①Unlike most animals, the tortoise's bladder acts as a holding tank, allowing it to reabsorb water back into its body. ②Incredibly, a desert tortoise can go a full year without taking in any freshwater at all. ③And because its bladder is so important to a tortoise's survival, park rangers often remind visitors not to stop and help the slow-movers across the road. ④The greatest threat to this desert tortoise comes from roadkill, which endangers its survival significantly. ⑤Tortoises become so terrified when people pick them up that they empty their bladders, losing their precious water reserves.

37. 다음 빈칸에 들어갈 말로 가장 적절한 것을 고르시오.¹⁷⁾

Imagine you are pedalling your bicycle on a level road. You stop pedalling: no force is now acting to move you forward. What happens? You gradually slow down. How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you slow down more suddenly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. This is the force called friction, which tends to slow down moving things by _____. Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you backwards as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be generating friction: mainly the axles. rubbing on the body as they rotate.

- ① growing against the pressure of the wind
- ② leaning in the direction of strongest support
- ③ moving along the path of least resistance
- ④ acting in the direction opposite to movement
- ⑤ rotating around the axis of the wheel

38. 주어진 글 다음에 이어질 글의 순서로 가장 적절한 것을 고르시오¹⁸⁾

All editing systems are now nonlinear computer-based systems that allow random access to any video shot or scene without having to fast forward or fast reverse to find it.

(A) Nonlinear editing, on the other hand, is like using a word processing program. If a mistake is made, it is easily deleted and fixed with a few keystrokes, and new information can be added easily.

(B) With nonlinear editing, shots or scenes can be easily added or removed anywhere in the program, and the computer adjusts the program length automatically. Linear editing was like composing a paper on a typewriter. If a mistake was made or new information needed to be added the whole piece had to be retyped.

(C) Nonlinear systems can create a range of special effects, such as slow motion, wipes and dissolves. Another highlight of a digital nonlinear system is its random access process that makes it easy for an editor to find desired shots or scenes without having to spend time fast forwarding or rewinding videotape.

- ①(A) - (C) - (B) ②(B) - (A) - (C) ③(B) - (C) - (A)
- ④(C) - (A) - (B) ⑤(C) - (B) - (A)

39. 다음 글의 밑줄 친 (A), (B)를 어법에 맞게 바르게 고치시오¹⁹⁾

A morally good person is one who does morally bad actions significantly less often than most and does morally good ones significantly more often than most. In judging a person not only her actions but also her intentions and motives are relevant. A morally good person must intend to do morally good actions and intend to avoid morally bad ones. A person who unintentionally prevents harm to others and does not harm them simply because things do not turn out as she intends is not morally good. Although this kind of situation generally occurs only in slapstick movies, it is worth (A)mention to avoid the false impression that it is the actual consequences of a person's actions that count toward her (B)judge morally good or bad. But actual consequences are important. A person who always tries to prevent harm but never does, is not generally thought of as morally good. Of such a person, it may be said that she means well; but, contrary to Kant, some results are necessary before she is regarded as morally good.

(A) : _____

(B) : _____

40. 다음 글에서 전체 흐름과 관계 없는 문장은?²⁰⁾

Vision is influenced by our preconceptions about reality. In viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities. For example, when visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. One would probably not visualize a hammer as seen from the top so that the handle is hidden by the hammer's head. The functional relationship we have with objects creates visual expectations that interfere with our ability to see "like a camera." ①The camera, like the human eye, sees only shapes and colors. ②It documents the world impartially through a lens that is similar to the eye. ③A photograph is more powerful than a thousand words because it captures emotions and moments instantly and vividly. ④When we look at them carefully, photographs are often surprising because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. ⑤And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

41-42. 다음 글의 문맥상 빈칸 (A)에 들어갈 말을 주어진 철자로 시작하는 단어를 본문에서 찾아 쓰시오²¹⁾ (필요시 단어형태 변형)

"May I help you?" are the worst four words that a retail salesperson can utter because they don't encourage the customer to talk and put them on the defensive. The four words usually draw out a negative response that stops cold a sales transaction. Examples of better questions to use when approaching customers are "Is there anything in particular that you are looking for?" and "Are you shopping for a gift?" If a fashion salesperson approached you with "May I help you?" chances are you would feel the salesperson didn't care. This line is a rote approach that is so overused by untrained and uninterested salespeople. In fact, most of us shudder in horror on hearing these words. The very meaning of the question "May I help you?" implies that the customer is in trouble of some sort and needs rescuing. This almost always puts the customer on the (A)d_____. "No, thank you" is usually the immediate response, even if the customer is actually in need of assistance. The subconscious thought by the customer is often "I'm smart enough to figure out what I want, and I don't need your help!"

If customers feel pressured or cornered, then salespeople won't make any sales. The approach has to promote a comfortable environment that makes customers feel there is no rush. Furthermore, if customers just want to look around, they should feel that it is all right to do so. In situations where customers really do want to look around on their own, salespeople should give customers their business cards and keep themselves accessible in case customers have questions or concerns.

Big mammalian herbivore species react to danger from predators or humans in different ways. Some species are nervous, fast, and programmed for instant flight when they perceive a threat. Other species are slower, less nervous, seek protection in herds, stand their ground when (A)[threatening / threatened], and don't run until necessary. Naturally, the nervous species are difficult to keep in captivity. If put into an enclosure, they are likely to panic, and either die of shock or hit (B)[them / themselves] repeatedly to death against the fence in their attempts to escape. That's true, for example, of gazelles, which for thousands of years were the most frequently hunted game species in some parts of the Fertile Crescent. There is no mammal species that the first settled peoples of that area had more opportunity (C)[domesticating / to domesticate] than gazelles. But no gazelle species has ever been domesticated. Just imagine trying to herd an animal that runs away, blindly hits itself against walls, can leap up to nearly 30 feet, and can run at a speed of 50 miles per hour!

For a species born in a time when resources were limited and dangers were great, our natural tendency to share and cooperate is complicated when resources are plenty and outside dangers are few. When we have less, we tend to be more open to sharing what we have. Certain nomadic tribes don't have much, yet they are happy to share because it is in their interest to do so. If you happen upon them in your travels, they will open up their homes and give you their food and hospitality. It's not just because they are nice people; it's because their survival depends on sharing, for they know that they may be the travelers in need of food and shelter another day. Ironically, the more we have, the bigger our fences, the more sophisticated our security to keep people away and the less we want to share. Our desire for more, combined with our decreased physical interaction with the "common folk," starts to create a disconnection or blindness to reality.

Scarcity encourages (A), as seen in nomadic tribes, whereas abundance, security, and desire for more often (B) generosity and social connection.

- | | (A) | (B) |

Whether we feel happy or sad, content or discontent, ①is not determined merely by each individual successive moment of life experience — a good thing happens and I'm happy, a bad thing happens and I'm sad. While our experiences affect our mood, we are not ②blown in a completely new direction by each gust of wind. As humans, we adjust — to new information and events both good and bad — and return to our personal default level of well-being. There will be highs and lows, but over time, like water ③seeking its own level, we are pulled toward our baseline — back up after bad news and back down after good. The euphoria of first love fades, and so ④is the despair of a break-up. This tendency is best seen with little kids and their toy joy: When they get ⑤what they've longed for, they believe they will be happy for the rest of their lives. And for the first few minutes of the rest of their lives, they are. But then the kids — like adults — adapt.

32. 다음 글의 제목으로 가장 적절한 것은?³³⁾

Although you may put off going to sleep in order to squeeze more activities into your day, eventually your need for sleep becomes overwhelming and you are forced to get some sleep. This daily drive for sleep appears to be due, in part, to a compound known as adenosine. This natural chemical builds up in your blood as time awake increases. While you sleep, your body breaks down the adenosine. Thus, this molecule may be what your body uses to keep track of lost sleep and to trigger sleep when needed. An accumulation of adenosine and other factors might explain why, after several nights of less than optimal amounts of sleep, you build up a sleep debt that you must make up by sleeping longer than normal. Because of such built-in molecular feedback, you can't become accustomed to getting less sleep than your body needs. Eventually, a lack of sleep catches up with you.

- ① Body Uses Adenosine To Manage Sleep Deficit
- ② Quality Of Sleep Outweighs Mere Hours Slept
- ③ Why Sleeping At Night Benefits Human Health
- ④ Time Zone Changes Interfere With Proper Sleep
- ⑤ Cognitive Abilities Decline When Sleep Is Insufficient

One of the things that makes uncertainty difficult for members of the public to appreciate is that the significance of uncertainty is relative. Take, for example, the distance between Earth and the sun: 1.49597 X 108 km, as measured at one point during the year. This seems relatively precise; after all, using six significant digits means I know the distance to an accuracy of one part in a million or so. However, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is larger than the distance between New York and Chicago! Therefore, (A)인용된 숫자가 '정확한지' 아닌지는 내가 그것으로 무엇을 하려고 하느냐에 따라 다르다. If I care only about what minute the sun will rise tomorrow, then the number quoted here is fine. If I want to send a satellite to orbit just above the sun, however, then I would need to know distances more accurately.

Richard Heinberg, an American journalist, argues that in building the renewable energy infrastructure to stop global warming, we are actually involved in one of the greatest change projects in human history. In addition to solar panels and wind turbines, we have to build an alternative transport infrastructure, farming procedures and industrial processes. This transformation cannot happen without fossil fuels. For instance, production of concrete structures and steel elements require amounts of energy that is only possible to produce with fossil energy. Production of solar panels requires scarce and expensive minerals which must be excavated, again requiring the use of fossil fuels. Thus, (A)우리가 재생 가능 에너지 시스템을 향하여 더 세계 밀고 나아갈수록, 더 빠르게 우리는 건설 과정에서 화석 에너지를 사용해야 한다. This is not only expensive, but also an undermining factor for our efforts to cut global emissions. Heinberg remarks that the cost of building this new energy infrastructure is seldom counted in transition proposals, which tend to focus just on energy supply requirements.

Likewise, literature throughout history has dreamed of creating human-like creatures and thinking machines (e.g., Mary Shelley's Frankenstein).

Humans for centuries have dreamed of machines that could become intelligent and make human-like decisions. (①) There have been myths about robots, automatons, and artificial beings since ancient Greece (e.g., the myth of Pandora, who released ills upon the world). (②) In 1950, British mathematician Alan Turing asked whether machines could think and reason like humans and then developed the Turing test to measure a machine's intelligence and whether the machines can think autonomously. (③) A few years later, MIT professor John McCarthy coined "artificial intelligence," replacing the previously used expression "automata studies." (④) Since then, artificial intelligence has become the study and practice of "making intelligent machines" that are programmed to think like humans — endowed by their creators with reasoning and learning. (⑤)

The desert tortoise has a simple solution for coping with Death Valley's extreme heat: It avoids it. The slow-moving creature hibernates during the winter and stays in its tunnel for much of the summer, meaning that it spends more than 90 percent of its life immobile. In fact, the tortoise usually only surfaces after a good rain. Then, it gets to work. The tortoise stocks up on water by eating plants and digging holes to collect rain. But to stay supplied with water through its extended hibernation, the reptile relies on something else – its highly sophisticated bladder. Unlike most animals, the tortoise's bladder acts as a holding tank, allowing it to reabsorb water back into its body. Incredibly, a desert tortoise can go a full year without taking in any freshwater at all. And because its bladder is so important to a tortoise's survival, park rangers often remind visitors not to stop and help the slow-movers across the road. Tortoises become so terrified when people pick them up that they empty their bladders, losing their precious water reserves.

- ① Tortoises avoid extreme heat by staying in tunnels extensively.
- ② They remain mostly immobile throughout more than 90 percent.
- ③ Their sophisticated bladder reabsorbs water for extended survival.
- ④ Park rangers advise visitors to help tortoises across the road.
- ⑤ Tortoises panic when picked up by visitors and empty bladder.

37. 다음 글의 (A),(B),(C)에 들어갈 단어로 가장 적절한 것은?³⁸⁾

Imagine you are pedalling your bicycle on a level road. You stop (A)[pedalling / to pedal]: no force is now acting to move you forward. What happens? You gradually slow down. How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you (B)[slow / to slow] down more suddenly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. This is the force called friction, which tends to slow down moving things by acting in the direction opposite to movement, that is backwards. Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you (C)[forwards / backwards] as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be generating friction: mainly the axles. rubbing on the body as they rotate.

All editing systems are now nonlinear computer-based systems that allow random access to any video shot or scene without having to fast forward or fast reverse to find it. Nonlinear systems can create a range of special effects, such as slow motion, wipes and dissolves. Another highlight of a digital nonlinear system is its random access process that makes it easy for an editor to find desired shots or scenes without having to spend time fast forwarding or rewinding videotape. With nonlinear editing, shots or scenes can be easily added or removed anywhere in the program, and the computer adjusts the program length automatically. Linear editing was like composing a paper on a typewriter. If a mistake was made or new information needed to be added the whole piece had to be retyped. Nonlinear editing, on the other hand, is like using a word processing program. If a mistake is made, it is easily deleted and fixed with a few keystrokes, and new information can be added easily.

- ① Why Video Editing Demands Precision And Patience Always
- ② Nonlinear Thinking Offers Solutions When Normal Fails
- ③ Nonlinear Editing Offers Flexible Program And Scene Control
- ④ Nonlinear Equations Reveal Complex Patterns In Mathematics
- ⑤ Editing Becomes Simpler With Artificial Intelligence Tools

39. 주어진 단어를 활용하여 우리말 (A)와 같도록 영작하시오.⁴⁰⁾

A morally good person is one who does morally bad actions significantly less often than most and does morally good ones significantly more often than most. In judging a person not only her actions but also her intentions and motives are relevant. A morally good person must intend to do morally good actions and intend to avoid morally bad ones. A person who unintentionally prevents harm to others and does not harm them simply because things do not turn out as she intends is not morally good. Although this kind of situation generally occurs only in slapstick movies, (A)그녀가 도덕적으로 선하거나 나쁜지 판단되는 것에 중요한 것은 한 사람의 행동의 실제 결과라는 잘못된 인상을 피하기 위해 언급할 가치가 있다. But actual consequences are important. A person who always tries to prevent harm but never does, is not generally thought of as morally good. Of such a person, it may be said that she means well; but, contrary to Kant, some results are necessary before she is regarded as morally good.

the false impression / it / her / judged / worth / the actual consequences of / to avoid / mention / that / it / a person's actions / that / is / morally good or bad / count / toward / is / being

Vision is influenced by our _____. In viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities. For example, when visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. One would probably not visualize a hammer as seen from the top so that the handle is hidden by the hammer's head. The functional relationship we have with objects creates visual expectations that interfere with our ability to see "like a camera." The camera, like the human eye, sees only shapes and colors. It documents the world impartially through a lens that is similar to the eye. When we look at them carefully, photographs are often surprising because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

- ① frameworks for ethical reasoning
- ② analyses of linguistic patterns
- ③ preconceptions about reality
- ④ obsession with consistency
- ⑤ innate neurological responses

Many atoms in your body are nearly as old as the universe itself. When you breathe, for example, only some of the atoms that you inhale are exhaled in your next breath. The remaining atoms are taken into your body to become part of you, and they later leave your body by various means. You don't "own" the atoms that make up your body; you borrow them. We all share from the same atom pool because atoms forever travel around, within, and among us. Atoms cycle from person to person as we breathe and as our sweat is evaporated. We recycle atoms on a grand scale. The origin of the lightest atoms goes back to the origin of the universe, and most heavier atoms are older than the Sun and Earth. There are atoms in your body that have existed since the first moments of time, recycling throughout the universe among limitless forms, both nonliving and living. You're the present caretaker of the atoms in your body. There will be many who will follow you.

- ① Your Body Shares Atoms With Entire Universe

41-42. 문맥상 (A)와(B)에 들어갈 연결사로 바르게 짝지어진 것은?⁴³⁾

"May I help you?" are the worst four words that a retail salesperson can utter because they don't encourage the customer to talk and put them on the defensive. The four words usually draw out a negative response that stops cold a sales transaction. Examples of better questions to use when approaching customers are "Is there anything in particular that you are looking for?" and "Are you shopping for a gift?" If a fashion salesperson approached you with "May I help you?" chances are you would feel the salesperson didn't care. This line is a rote approach that is so overused by untrained and uninterested salespeople. (_____ A _____), most of us shudder in horror on hearing these words. The very meaning of the question "May I help you?" implies that the customer is in trouble of some sort and needs rescuing. This almost always puts the customer on the defense. "No, thank you" is usually the immediate response, even if the customer is actually in need of assistance. The subconscious thought by the customer is often "I'm smart enough to figure out what I want, and I don't need your help!"

If customers feel pressured or cornered, then salespeople won't make any sales. The approach has to promote a comfortable environment that makes customers feel there is no rush. (_____ B _____), if customers just want to look around, they should feel that it is all right to do so. In situations where customers really do want to look around on their own, salespeople should give customers their business cards and keep themselves accessible in case customers have questions or concerns.

The act of gardening itself is a fantastic form of physical activity. It involves a range of motions, from digging and planting to ①watering and harvesting. These activities help improve strength, flexibility, and endurance. You might not realize it, but small tasks like weeding or turning compost can burn many calories. Gardening is particularly beneficial for those who find traditional exercise ②challenging. It's a low-impact way to stay active and fit, making it accessible for people of all ages and physical abilities. Besides physical health, gardening has profound mental health benefits. Tending to plants can be incredibly calming and meditative. It allows you ③to focus on the present moment, reducing stress and anxiety. The repetitive tasks ④involved in gardening can induce a state of mindfulness, similar to meditation. Studies have shown that spending time in nature, even in a small garden, can elevate mood, improve cognition, and reduce depression symptoms. The sense of accomplishment from watching your plants ⑤to grow and thrive can also boost self-esteem and overall well-being.

23. 다음 글의 (A),(B),(C)에 들어갈 단어로 가장 적절한 것은?⁴⁵⁾

For many centuries, humans have taken advantage of tools that translate and bring into our perception natural phenomena (A)[that / where] we can't perceive with our senses. In some cases, this consists of simply amplifying signals that feed into our normal sensory inputs (e.g., telescopes can bring into clear view that which is too far away for our eyes (B)[perceiving / to perceive] on their own). Other instruments turn signals that we cannot perceive into ones that we can observe. Some of these take the form of expanding the reach of our current senses, such as creating visible images based on the ultraviolet spectrum of light or changing sounds that are normally outside the range of what human ears can hear into audible signals. Alternatively, some instruments measure properties (C)[which / for which] we have no sensory capacity at all and change them into that which we can observe.

Many opponents of animal experimentation argue that (A)현대 의학이 사망률 감소의 유일한 원인이 아닐 뿐만 아니라, 인간 건강에 기여했던 많은 의학적 발전이 동물 실험의 결과와 아니었다. Defenders of research have claimed that since there is a strong correlation between the practice of animal experimentation and medical advancement, the former caused the latter. Opponents of research reject this inference. After all, we have independent reasons to expect these phenomena to be correlated. Since the law prescribes that all new drugs, prosthetic devices, and surgical techniques be tried on animals before they are used in humans, we will subsequently find that all medical advances are correlated with prior experimentation on animals. Consequently, the correlation between animal experimentation and medical discovery is the result of legal necessity, not evidence that animal experimentation led to medical advances. Moreover, several influential physicians have offered historical evidence that animal experimentation has not been as responsible for biomedical discovery as defenders suggest. They claim that clinical discoveries played a more substantial role than animal researchers have led us to believe.

many medical advances / not only / human health / is / not / animal experimentation / contribute to / the only cause / the result of / in mortality / modern medicine / for the decline / that / did / were / not
